A ground-breaking new research report has been released today by the analysts at Meteo Protect demonstrating that despite the best efforts of government leaders and international organizations to lead the response to climate change, their efforts have not been able to galvanize the key players who can make a difference. In fact, not only are they not engaged, they do not even know they are already at risk.

A new White Paper from Meteo Protect modelling the impact of climate variability on the private sector finds that climate change is already making a significant impact in the profits of companies operating in sectors exposed to weather. Directly challenging the direction of present empirical research, and the consensus of how to respond to climate change, it identifies how and why private industry, including companies and investors, must act immediately to manage the consequences of climate change.

Indeed, the extent to which the vast majority of companies are presently exposed to climate variability is likely to be a revelation for many analysts, investors and even companies executives themselves. Demonstrating that billions of dollars are at risk each quarter, continuing to go unreported and unmanaged, the researchers call for the provision of actionable and objective indicators to measure the

exposure to climate risk and the implementation of mitigating weather hedging strategies to protect financial performance.

A must-read for finance executives, investors, asset managers and business analysts, the White Paper takes a new approach to tackling a long-standing and unresolved problem, making it understandable, relevant and manageable.
