publication of this article

This study aimed to look into the impact of educational practices on the reading and writing skills of learners, with a specific focus on the gaps and bonds in EFL learning while communication skills carried follow-ups. The study employed a mixed methodology, which embraced communication contexts placed in the teaching process, and self-perceptions of the participants in a multidimensional communication axis to collect data via surveys, observational forms and exploratory statistics. The results indicate that while there is a stable level of variation in terms of reading and writing achievement, there are setbacks in certain areas such as fill-in-the-blank questions in complex activities and sentence rewriting tasks. Additionally, the study found that providing students with picture clues can improve their performance. The study also suggests that blending both reading and writing skills in activities can lead to large linkages and improvements in performance.

## 1 | INTRODUCTION

Reading-driven initiatives befall with teachers' display and efforts to benefit both parties — students and teachers — in vocational success via habits promoted as an epitome to peruse in a self-reliant process (Castro and Argudo, 2022). Strategies geared to the success of writing lead to content streamlining via follow-ups on writing status that goal to maximise motivation and curtail anxiety in composition writing (Xu et al., 2022).

Spurring rapport in the classroom is a must by all means. In-class engagement ultimately serves for the vast majority of cases as communication activities reflect their abilities and how the production of tasks impacts their professional lives. Withal, communication constraints can arise related to learner's ephemeral language opportunities to master in the classroom (Al-saghiar, 2022).

In closing years, a persistent endeavour regarding literacy-focused skills evinces major close-ups in literacy-focused communication in ingenious tasks through up-to-date means that bid spoke learning. Improved instruction entails advanced monitoring to check such progress and achievement, in which students decrease their participation when performing such exercises over a long-term period.

Continuous learning procedures can disturb writing achievement, i.e., task performance, lexical resource, grammatical scope, accuracy, consistency and cohesion, and earmarking vital elements in the development of writing competence (Pham, 2022). Amid pedagogy perceptions on coping with a symmetrical acquisition, mindfulness of context scenarios to teach is wide of knowledge perforce. Then, it exceedingly acknowledges that language domains are a subject to communication and refer to the divergent skills required for activities in real-life circumstances. Reading and writing achievements set is a case in point, which is regarded to bind a tremendous level of pedagogical proficiency, notably for L2 learners. A component to mull over this matter is validity teaching for supporting course understanding further speech (Mali, 2022). As knowledge dearth arises for the production and review of learning within the classroom

context, the learner's literacy and acquisition curve are deliberately steeper.

Transitory learning shifts define the long-term achievement of EFL learners, i.e., acquisition stages occur solely in the teacher's classroom guidelines and do not stretch beyond the school context. It thereafter lies in active participation in improving the teacher's overall shortcomings or amiss performance regarding the teacher's classroom direction in skills-based accomplishments. Subsequently, this research can be advantageously grounded on covering learning in language domains with digital methodologies to boost classroom execution (Indah et al., 2022).

Likewise, practice and reinforcement of specific skills come naturally to learners; sooner, mismatches in skill learning arise as a result, and communication agencies promise to instil an utmost commitment in students to embody an equalisation of yearned skills. Activities performance inhibits comprehension of learning routines, i.e., noticeable gaps in students' involvement. Namely, nominal standards for communication skills through on-going follow-up or monitoring.

Under this procurement spectrum, children's learning to gain a foreign language ascribes inextricably to instructors' boundaries. Seamlessly, the decisional instruction inputs students-paced preparation with interest in obtaining enhanced learning in the language abilities on account of the decision-making role that compels a student to collect at the end of a course as an exit profile.

Pinpointing the glimpse into behavioural communication pitfalls, social skills in a regular milieu unveil measurements independently per pupils on the criteria encountered in training for the alleviation of social anxiety in the classroom (Casale and Haahrhoff, 2022) and to accommodate the individual's challenges in specific scenarios involving social skills under demeanour assessment parameters which are tailored to fulfil the learner's interpersonal needs.

Literacy as a day-to-day part of society complements a vital element of the individual's social and interpersonal growth as the essential component of daily communication, broadening the vision of the member's abil-

ities with prolonged experience of the social context, and swelling its vision of the language core and communication skills in a current recognition for schooling sphere (Hadianto et al., 2022).

As education strives to yield better and more comprehensive literacy support in recent years, new technologies, which affect and ease the practice in terms of technique and appropriateness, have bolstered practical deployment into a classroom. As musing on certain partnerships, it kindles that literacy-aligned methodology merges with resourceful tools. This workaround allots for reflection on instructors' processes and classroom skills within self-evaluation and even extrinsic assessment for each stage of learning, with feedback and input to classroom management and competencies (Seufert et al., 2022).

Literacy learning operations are challenging in under-developed nations due to infrastructure, resource accessibility, learner follow-up, desire for learning, and a lack of supervised practice. Despite the setbacks of learning a mother language through a framework, schools can satisfy criteria that incorporate all of their stakeholders' required capacities for citizens' social development. Because of the social and economic value of learning a foreign language, governments control language literacy among non-native speakers more strictly. This is seen in a diverse curriculum in order for students to meet standards of language comprehension or use, which are often heavily influenced by international frameworks already well established at the global level, such as the CEFR, in order to have a clear basis for designing future learning achievements in the curriculum.

These studies collect in-depth experiences and judgments of stakeholders in school settings by examining the levels of impairment in groups of students when exposed to integrated language learning conditions over time. Namely, supplementing the intended classroom knowledge and their own knowledge integration to establish autonomous development in children with stimuli in engaging with the curriculum design (Shin, 2020).

The alignment of competencies between the body institution and government standards is an example of modifying the curriculum to integrate the content of

vital competencies using tried-and-true methods. The competencies are centred on workflow and scalability because the lessons cover many levels of learners and are given through the quality of the teacher's approach. The effectiveness of the curriculum is divided into smaller sections containing critical skills and knowledge to maintain a compact content of study through tracking skill interests or personal qualities, then moving on to a more complex topic within strategic planning and academic development. (Honeyman et al., 2022). As in South America, the valid versatility of students in literacy skills enables them to work self-directed through close collaboration with other students. However, gaps are plausible for teachers, whereas mastery of essential and critical skills is especially lacking in writing. (Mateus et al., 2022).

Perforce, it mulls over that the key areas in which language competency is assessed are uneven, with structure tasks being the most popular and thus the ones that students spend the most time on; nevertheless, they are also the ones that students may become weary of completing, and in order to assure future academic success and the pressing need to acquire a second language, teachers must be motivated and willing to give learning that is not focused on teacher-dependent work. This tackles whether the teacher should take a more active role in the learning process, which is especially important in developing countries where various tactics are used to keep up with the culture of neighbouring countries.

Communicative skills-based instruction draws on lesson planning design — powered by a framework that sizes up behavioural characteristics in the course of each learner's learning session and then in the autonomous production of writing and reading assignments — which aims to progressively cover the learner's progress in contemplating errors and shortcomings that may arise on an individual basis, and then to reformulate the imbalanced performance shown and enhance the learner's independent learning throughout the classroom.

Similar grounds, namely the study of literacy instruction setting concerning the learners' abilities, (e.g. Piasta

et al., 2022) sustain the strengths of early literacy education in that effective learning is achieved with the guidance and input of the teacher through consideration of the instruction, the learner's background, and the context in question.

Due to the low standards that students frequently reach, issues such as poor interest, inadequate instruction, repeated chores, or inaccessibility of resources damaging to English learners in such places, writing and reading tasks are the skills that draw the most attention to work. The writing activities differ in that they will be produced in distinct circumstances. Thus, learners will be able to employ a variety of language uses in different settings, as well as writing tasks that contain categorisations to be unique in each instance of use, aided by a systematic set of prompts that present a wide array of contextual possibilities to be employed on student's speech acts (Tasker, 2022).

Inter alia, writing activities also present a significant problem for students to complete or perform several activities under the same reading. It can also be frustrating for students to read large amounts of text and not be able to find the answers that are requested, which is often associated with the poor reading habits that young people have today attached to the most common factors in young students as the overwhelming boredom that reading causes and mainly if it is not their mother tongue. The commitment that learners engage with the development of reading tasks in a sustained manner is achievable by means of learning strategies that will lead them to gain greater satisfaction in the learning process during the set time (Ji et al., 2022). Reading comprehension through a comprehensive approach has been beneficial to language skills through teamwork. Despite the discouraging study patterns of EFL students, there is a dormant interest in the enjoyment of reading activities. In most settings, dealing with reading activities engages students in greater autonomy in the course of learning Sevy-Biloon (2022).

Writing and reading qualities are tightly related, with connections and reciprocity. In the development of each one, there are interruptions, which are vital in knowing the difficulties in learning that someone has either in

reading or writing (Kim, 2022). Achievements in reading and writing are usually inauspicious in e-learning environments. Despite the effort that is made, if there is no proper planning on how to prepare the students to stay engaged and not disturb their degree of satisfaction when doing it, this will turn out in weak and temporary learning in the learner, making progress in reading comprehension and spelling very deficient.

The communication of all the stakeholders involved in learning dictates the extent of improvement and progress each child can achieve. As usual, there are challenges in keeping students active through innovative and non-repetitive tasks. Parents would also play a decisive role in spurring an ongoing interest in reading and writing. Work at home impacts the assessment and adaptability of language and vocabulary in children that, in most scenarios, would not be feasible without parental involvement, or in other words, if all the burden of creating relationships with reading and writing were to fall on the teacher, it would be less effective and more arduous to carry out.

Shared reading would help to engage and motivate students, and accompanied literacy at an early age would empower children to enter formal education with a broad background in oral language, i.e., confidence in spelling and discriminating, alternatively, connecting words (Shen and Tufo, 2022). Hence, literacy sports pursuance in which students need the assistance of numerous stakeholders as well as personal and environmental features to be studied and addressed with the techniques of reading and writing instruction. Thusly, the monitoring of communicative skills accurately portrays the direction a student can attain in their learning and anticipates potential future achievement in essential competencies of the ordinary human being. It is essential to comprehend that learners must be equipped with reflective feedback by the teacher as a means of amending reading and writing misimpressions, rather than by themselves (Gilliland, 2022).

Students adopt diverse stances when they are exposed to learning, in which each student reacts distinctly to carrying out such tasks that validate the knowledge gained in class. Thus, an educator must have as the

core the communication and bonding among students to gather knowledge through multiple teaching methods geared to the areas to be covered, with logical and comprehensible information and guidelines for all.

This work has as an initiative the pursuit of a study group for the ongoing teaching in study units to contain tests that review and follow the progress of each member; this is not confined to the enrichment of the educational practice but, to strategically present the grounds necessary to handle the type of abilities in reading and writing by establishing items that are adapted to the conditions and aptitudes of each one. In addition, through being able to know the environment of each participant, it allows setting relationships with the communication that occurs around to tailor the topics of class in an approachable and accessible fashion. The performance varies within the time when writing and reading might render a gap in learning performance. Where classroom resources and their validity for the course can lead to a major indicator for learner engagement, just like reducing pressure in literacy practice (Namaziandost et al. (2022)). For this fact, it is imperative to give a treatment to the planning in class. With the knowledge of the conceivable gap between an area of practice, the aspects that work in transmitting information are interconnected to achieve learning on a personalised basis.

There are overwhelmingly divergent trends that point to the current conditions for handicapping and impeding a student's ability to achieve excellent competency in reading and writing, as this study addresses those challenges and needs with a clear roadmap in the student's development's reading and writing skills. It is comely to deem the incursion of organising content to literacy task's acquaintance, then ameliorate in their language production (Wang, 2022). This is to revise teaching practice in reading and writing domains within blended modalities and suchlike by leading communication skills in the classroom, including the narrow spread that exists when boosting in-class tasks and activities, ergo creating enriched learning in real-life scenarios for EFL learners.

Likewise, the learning wave renders a significant impact on the lives of students. The effective relationships

that each one creates form bonds between the others around them and enable them to handle the message to be transmitted. They are also determinants for the smooth understanding and integration of the class, so the attitude presented by the student will shape their willingness to comply with the attainment task. This study addresses efforts to ease communication skills flow by meeting the pitfalls of classroom practice and grasping how the study group gradually fulfils in foreign language scenarios. It channels to link existing communication skills before and after language interaction and how this moulds and resonates in each learner's academic and personal life. It is advantageous for this theme, spurring interactivity through the contents of writing and reading, since it involves a significant worth to critical thinking development (Tilahun et al., 2022).

Additional concerns are pondered as it provides versatile, interactive and flexible activities for competent cooperation in the classroom and everyday purposes that learners can execute proficiently on their own. Furthermore, it is highly remarkable to distinguish the overall engagement quality in learning that participants eventually gain, alongside the underlying skills developed in the classroom.

In the study making, it enacts a framework for approaching communication skills aimed at the treatment and scope of writing and reading item tasks in asynchronous learning. Then, it can be enlightened on the strengths and weaknesses comprising the writing and reading processes over time within the study, which met learners' needs with tailored delivery techniques. Each participant must be assessed in harmony with performing several sessions to ascertain the gaps that prevail in the examined areas.

Furthermore, this would assist in even the askew learnedness in the needful areas. Holding measurement instruments, such as structured observation instruments and survey-based data measurement systems, from scratch. Allowing participants to distinguish the overall engagement quality in learning that they eventually produce, as well as the relational and social skills developed in the classroom. On account, digital features of teaching courses can boost students to make

the most of the resources in the classroom, and it offers a vital avenue for them to grow as self-monitoring individuals (Umamah and Cahyono, 2022).

This study comprises the development and monitoring of basic skills that enable successful literacy in social contexts in an environment focused on L2 competencies; it also considers the analysis and improvement of educational practice as a result of triggering behaviours and reading-writing achievements, which may present an abysmal or minor gap between each, as is common in students focusing on a specific subject area. Creating a classroom monitoring system that includes concepts such as acquisition and adjacent communication in skills is primarily designed to discover common qualities found in EFL learning environments. This includes the planned and methodological modifications to learners' success and sustainability, such that a varying paradigm suits a field of research related to the validation and relevance of the learners' experiences to the learning successes provided in each session. The follow-up of learning is in sync with patterns of practice and progress in work, which are generated from a naturalistic approach inside the lesson, within the comprehension of learning and its proper usage in real scenarios.

Similarly, learner backgrounds and communication skills influence how students interact in the classroom (Yang, 2022). These learning accomplishments may have varied attributes; learning in this sort of study favours people systematically delivering abilities across many traits that restrict and lead to finding gaps in understanding.

As a result, this fieldwork is organised to forward the classroom skills to be developed, the role of teachers and their conceptions of the influence of learning achievement on individual learners. Literacy and its current status in L2 learners, and other factors that address the monitoring of intrapersonal skills for acquiring comprehension knowledge, are also addressed. In order to prevent unwilling conducts and strategies that are irrelevant to their demands in learning activities, these conduct factors need extraordinary attention in suchlike modalities (Zhou et al., 2022).

It herewith ordains a paradigm for handling commu-

nication skills in asynchronous learning, with a focus on the treatment and scope of writing and reading item assignments. Moreover, this covers an examination process that delves into the research design, which underpins and clarifies the study's goals for writing and reading in target language settings, as well as following the path of knowledge development and expectations concerning non-native speaker communication and adaptation in EFL settings.

At length, the gaps that exist between writing and reading are examined, i.e., learning misalignment between them may occur and how they are earmarked to build a clear basis for language usage and its strengths in practising and improving such abilities. Thus, it offers precise results per the study's design and execution, as well as how the study translates the results into practical actions to treat this area of study and to understand the characteristics that the research attracted for forthcoming work that further the same interests in the skills improvement and literacy status quo.

## 2 | LITERATURE REVIEW

The close ties between communication skills and writing and reading achievements are grounded in the social and interpersonal contexts where learning takes place, in order to be decentralized in the staging of educational changes linked to the needs of each student to reach the expected levels in social and academic competences. Nevertheless, an awareness of language background and related factors is required so that refraining struggles in complex works (Hu, 2022). In this sense, it raises settings and points that are interconnected with the subject of the study to grasp and digest the sequence for an effective imparting that entails both the academic and the personal development of the pupil. Learning is hampered by the contextual factors that trigger personal traits that differentiate the personality and thus play a key role in making decisions about the teaching context. With instruction rooted in understanding the learner's behaviour according to the context in which they grow up, it will allow communication of outstanding results in

terms of communicative endurance through pedagogy, which anchors in its participants a sense of equity in the culture.

As culturally, schooling fosters teachers to consent diversity ameliorated on strengths, and ponder that kids engage in a wide range. Expanding on students' knowledge and skills from their home and community cultures gives a hook for children to turn in understanding as they relate what they know to what they are learning. The absence of familiarity or cultural awareness in the instruction would represent an obstacle to communication and expectations in the classroom (Ylimaki and Brunderman, 2022).

The leadership of the class for all students is dictated by the teacher, who must have the conversational competencies to establish a solid rapport in the classroom in order to achieve the performance provided in the areas the course requires. The class can take different approaches, they are usually focused on the student. In recent times it is committed to modalities in an instruction where the teacher is an advisor or the student takes more freedom in their decisions in class, nevertheless, all instruction must incorporate a transmission of information and the stimulus that the teacher manages to bring, the participation of the teacher constitutes a role that to a greater or lesser degree serves as a guide and an ambassador in the school context. The provision of guided instruction yields a positive relationship in student performance, this effort is moderated by the educational contexts for the effectiveness of the knowledge conveyed (Wu and Shen, 2022).

The solution at first sight for a teacher with ongoing difficulties in the classroom beyond the student's capabilities, is to determine the gaps in the practice to adjust the social and environmental conditions to the motivation and commitment of students to learn through the pedagogical support or mentoring of the teacher, this can be modest yet essential to serve in the amendment of flaws in the learner and thus a prevailing and sustainable L2 classroom in the interaction and connections between peers as well as with the educator.

Instructors are encumbered with difficulties in achieving key skills in the classroom in order to spare

professional expectations, with a strong focus on the agency and empowerment of individuals and educational communities. The teacher-student relationship develops a pedagogy of cooperation and democracy for ethical and socially equitable factors in discourse (Robinson, 2022).

In an effort to train students in the teaching of a foreign language, study items are developed that serve and execute the role of reinforcing what is learned in class with an attempt to access a certain piece of information or target language, introducing the learner to potential scenarios in which a speaker would be drawn, as well as serving as strengthening or enhancement activities that determine and store a student's knowledge through various teaching techniques that engage the individuals to reveal their understanding and rationale for the language. The practice and routine of these practices decrease with time, although the communication and interaction in class does not. On the basis of experiences for proficiency warrant, a personality can be forged in the language, which should be promoted in the classroom as much as is needed in the teaching and social process.

## 2.1 | Literacy agency

The chief strategies that occur in the instilling and teaching of literature through literacy learning techniques. Working in a classroom to foster reading habits highlights the shortcomings that a classroom may have, such as lack of infrastructure, resources, family conditions or lack of qualified teachers, as well as the effectiveness within the curriculum objective of reading activities that may also be a constraint or setback to established standards or educational policies that require individuals to adhere to them as outlined in the collective domain.

Educational systems to address learning needs have a role in laying out guidelines and directions for forward-looking outcomes and ensuring that certain conditions are followed so that they can be achieved as the education administration agency expects (e.g. Kosaretsky et al., 2022). Each district or its equivalent can establish certain standards and parameters that address community needs and quality. Furthermore, reckoning assess-

ment criteria in terms of quality, teacher competence, inclusive standards, or the appropriateness of educational models, is key for transition to modern modalities if required. Where curricular strategies should look forward to targeting their learning styles, contributing to educational success (Benitez-Correa et al., 2022).

Resources are provided to meet the member's needs that are plausible to respond to, and relationships are possible with the support of physical resources that enable its stakeholders to draw up instructions that ensure compliance and accountability of common rights. The learning to be operationalized follows a hierarchy of decision-making that corresponds best to the area and the target audience. Normally, there is a certain degree of autonomy for the core institutions to choose the learning approaches, or they are bound to abide by and comply with the given measures that respond to a general education. Then, in recent years, the breakthrough of a decentralized choice and route of teaching is narrowing somewhat. This can be rendered as intrinsic and social commitment to fulfil educational duties while grating exceptional quality of institutions teaching Fazlali (2022).

The measures that are taken are in conscience to attend to a range of subjects, depending on the area where this has been seen, there are greater or lesser considerations in education, but all follow the same principles in providing their individuals in social skills that will serve them for life. Actions to promote literacy start from the early years of the learner, where more and more obligations are added to the first years of education for the acquisition of a foreign language so that students can become familiar with and know the language as a foreign language in their early years will result in a great deal of mastery for adulthood, which is something that educational institutions strive to provide to their students in terms of language skills. With accurate and cohesive communication, a learner can include diverse academic language features including discourse traits that feature lexical and syntactic proficiency, then learners can create an atmosphere in communicative settings (Jo, 2022).

The techniques of creating communicative environ-

ments concern the instruction of writing so that what is taught in class brings about the expected learning outcomes by using genres that demonstrate a high mastery and practicality of the language, the assignments are created to demonstrate such ability in any literary variety with the use of professional language that was acquired in the classroom atmosphere. the situations experienced by the students are those that enrich the practice and production of assignments through the interactions and aids that the teacher can establish with the group of students. Owing to the limitations in the realistic interaction with the natural language, an EFL course should be nurtured by the teacher's practice to encourage and create meaningful learning moments that balance the limited time a student has to practice the language.

The design of instruction that contains non-native learners must invest and make a larger effort to reduce the barriers and constraints faced by non-native discourse learners to provide quality reading and writing with linguistic characteristics in their repertoire. Sharing features like learning experiences, learners restrictions can be identified in time via linguistic strategies for every case Chairunnisa (2022).

The skill level reached in terms of reading, comprehension, vocabulary, memorization, and pattern following, is connected to the social characteristics that have been acquired according to the stage and its exposure to the language target.

There are varieties within the delivery of the teaching, the L2 learners advancing as the teacher's input and explanations are passed on to them, literacy is boosted by the lexical and syntactic skills that are embedded in the design of the assessments and teaching paths to create such dialogical characteristics in communication and the degree of syntax that each student exercises for the acquisition and refinement on their skills. Literacy serves in this regard to create learning experiences through the classroom scenarios where students can create on their own pieces of information and grasp information that is valuable for their academic life. As this ability is acquired in partly from participation and strategies to respond to various conditions that a native speaker would normally

deal with, and which are conducive to evoking creativity and forming a lexicon with the fertility of grammatical structures or some kind of noun phrasing.

Inter alia, that serves for learners to construct their learning path as autonomy subjects, from activities yielding a sense of confidence and regulators (Hazaee and Almekhlafy, 2022).

Students who are placed in a scene of information gathering and understanding of the subject, must indirectly yield to the construction of the discourse, i.e. the shape in which they convey the message they are trying to say or the style in which they receive and produce what they have grasped. This set of lexical combinations provides a blueprint for how students will succeed in the coming years, the patterns of discourse are inherent to each student as they are adopted to capture knowledge in the writing and reading or in the discourse that was originated to create the underlying idea for the syntactic composition of the piece of information delivered. By inducing learners to practice and dominate different grammatical structures in cross-linguistic speech and complex-word verbalisms, the usage of lexical bundles, beyond gaining teaching pedagogy in L2 contexts, can also provide a well-knit naturalness degree in terms of proficiency on discourse staging acquisitions (Dahunsi and Ewata, 2022). The quality of learning is evidenced based on the literature in a number of production tasks as well as significant experiences with the lexicon of the EFL spectrum, which are differential depending on the attention that each learner gives to learning. Literature prevails in the learning content, students draw on it to form their own set of personality in language and to exercise skills in a myriad of tasks in social situations that are expected to endure the habits of action in literature for learners to set a productive fashion where they succeed scholarly and professionally with the endorsement of literacy states.

## 2.2 | Exploring teacher's conceptions on classroom practices

The instructional effectiveness lies primarily in the teaching employment to be envisioned to facilitate

compliance with learner-centred learning attainments, which encourage time-monitored assessment, classroom management, staffing, documentation procedures, peer support, and provision of evidence-based feedback for proper and effective engagement (Fan, 2022). Since the surge of literacy-pledged works on the teacher's commitment into EFL schooling in order to fetch quality teaching, the devotion drawn by an educator stokes to a hefty kinship of engagement in the benefit of an outcome-oriented L2 education whereby it is fuelled to underlying constructs in teaching adherence and enlighten implicating traits' role (Dong and Xu, 2022). Teaching practices and engagement warrant impinge on an involvement bedrock, as in closing studies conducted up to language teachers' display. For instance, foreign language teaching has shed the breakthrough towards a precise look at ethos to the degree of teachers' individual development as a social member that furthers commitment to practice and formulate their in-service identity while the curriculum unfolds (Jiang, 2022).

In general terms, within an everyday environment, one's own skills enable them to overcome and emerge from troublesome situations thanks to solutions that are a product of a social practice implemented in literacy skills (Hadianto et al., 2022). For the teaching point of view, educators supply opportunities to mingle the social context with the techniques of literacy so as to make them palpable for the target learners.

While the studies listed above probe into the value of teacher's workplace earnestness, these studies have reported more notional and awareness aspects of the teacher's implication in grabbing students' attention in the classroom. As a result, when students become compelled to remain through long lectures or recurrent learning, the teacher's role miscarry to return authentic learning experiences that is overseen in taking a less proactive role in activities that necessitate remuneration onto stimuli or payoffs (Kruk et al., 2022). With a turning point in the procedural intervention as to the teacher in the learning for L2 students, a supportive employ of immediacy stresses the regulation of emotions in students to seeking the learning delight, likewise it profits learners emotions through teacher self-regulation in bringing

up both parties' affinity in the teacher-student relationship with an interest-led movement of care ahead of the enjoyment while acquiring a foreign language (Guo et al., 2022).

### 2.2.1 | A look at learning experiences from teacher's view

A sizable number of scholars have labelled the latent connection between the enriching experiences of the EFL teacher and the self-relishing activities that underlie the etiquette and traits of the educator. Didactics expressions exert an inmost intellectual effort to empower the regulation and unfolding of emotional intelligence and thus to elicit a sense of comfort and fulfilment among all learners through the effluence of the EFL teacher's in-flow experiences — teaching immersion of which teachers can set a hefty quality of experiences for in-and-out classroom engrossment to its members — to usher in sharing the same attributes across stakeholders and prolonging immersive settings in the language learning (Sobhanmanesh, 2022).

In the continuity of the cognitive subject as a teacher, when it comes to fostering a work learning environment rich in preparation and resources that supercharge teachers to furnish their perceptions in the field of learning ahead of time, the association of professors' perceptions with mentoring in early formation educators proves to be outstanding (Nesje and Lejonberg, 2022).

For L2 instruction pertinency, the learner's inroads in language learning become key in contextualizing knowledge in academic contexts with robust strategies that call upon learners in adjusting comprehension by means of appropriate instructional implements and strategies applicable to the ongoing cognitive progression of the learner. Thus, as efforts towards achieving learner output that both validates and captures prior learning, learner-goaled strategies can polish the learner's conceptions to cope confidently when facing real-life language scenarios in a dialogically competent fashion. That is to say, EFL educator's approach should seek an instruction oriented on the authenticity of language development resulting in sustainable linguistic progress so

that the learner can master the productive skills for foreign language literacy at the experiential threshold concerning self agency practices via strategies introduced to improve language literacy (Usó-Juan, 2022).

Similarly, concerning the case of non-native teachers identity in training, positive effects have been displayed in terms of experiential relationships involving students in spontaneous L2 communication for their English perceptions' improvement, thereby acknowledging multiculturalism strategies within communicative contexts in diversity understanding, so that pre-service teachers can interact with a sociocultural focus on linguistic tolerance among speakers as language users ought to be mindful of their language's constraints and others' language expressive styles and cultural identity to featuring a noticeable a tenure state of one's language varieties (Raja et al., 2022).

For the scoping of teacher's decisive role in the sphere of evaluation, a major support for classroom quality is exacted at premature schooling. Classroom-based interactions in the school setting engage the development of skills and language, with benefits in teaching prize and childhood assist as children's literacy skills results utterly tie in pointing education degree by process measures in assessment — linguistic, identity, emotional, psychological features (McDoniel et al., 2022).

### 2.2.2 | Teacher's role and agency on current research state

Research on the inherent work of EFL teachers yields a deep systematization of learner development in the properties of applied linguistics. One such view that canvasses space in language learning is learner autonomy, with an emphasis on encouraging a compelling learning strategies that extend across schooling by seizing the hands-on function that the language learner spiels in sparking-experiences intercession for self-reliant learning with gradual developmental changes in personal formation. Hence, it hones the autonomy habits with learning opportunities and skilled pedagogy patterns in noticeable conducts that learn their own autonomy extent (Chong and Reinders, 2022).

From the perspective of boosting teacher research, as L2 acquisition and literacy foundations can socially further to practical problem-solving cases in educational scopes from the sense of purpose and meaning in writing (Matthiessen and Yousefi, 2022), and favours constructive learning attainments coupled to gratifying experiences in real-world learning situations that endow students the highest satisfaction rates for applied language learning (Botes et al., 2022).

However, L2 learners' learning success becomes a multifaceted system whose effects are derived from extrinsic factors that bear on how learning proceeds in order to gain certain achievements, and to which constructs illustrate the benefits that can be reaped by factoring in the motivational dimensions of language learning (Yousefi and Mahmoodi, 2022).

Teachers' adjustive activity in addressing learner troubleshooting within a variety of classroom needs prevents unintended achievement, intrapersonal conflicts, stagnation in cognitive or performance difficulties. Nonetheless, when striving to implement diversity-first teaching in student-centred approaches, it furthermore clusters school assistance and resource backing as the teacher overlays school-based assets with significant measures to socially encourage children covering their inhibiting learning behaviours in a timely manner. Situational factors that are part of the school environment wield an immediate and major impact on student accomplishment, shape the opinions of teachers and how they experienced school attention. The rationale for student support strategies lie on teacher's ability to suggestively spot children who require help across a range of circumstances so that it uses that information to conduct preventative touchstones for difficulties that widen the classroom scenario. (Solberg et al., 2022).

Within meta-analytic studies, outcomes hold fewer signs of improvement or divergence in teacher intervention for certain learning strategies, such as guided play-based approaches over rudimentary direct teaching, i.e., guidance during play environments in skills support and childhood development in literacy learning is a non-determinant predictor of proficiency across language areas given slim ranges of benefit evidence over

one approach for literacy skills or another (Skene et al., 2022).

### 2.2.3 | Teachers perceptual process ahead of L2 strategies for learner outcomes

In the perceptual development process, teachers' perceptions are conceived as a career development leverage as a consequence of commanding their own learning pathway through monitoring intellectual features. Within the sociocultural aspect, immersive settings make a space free to the opinion of others, expecting from the learner a personalized standpoint of the content to lead to the realization of the being' self understanding through beliefs or aspirations towards creativity in education, above and beyond the linguistic application in creating concepts and training in dialogic thinking, the visual means implies a notorious key in communication to grant its stakeholders skills building in a deliberate environment at diversity practicum (Lähdesmäki et al., 2022).

This line of exploration has expounded a number of shifts and discernments from an overarching immersion on examining how teacher perceive students agency and their function with an influence in learner development and professional self-growth above classroom context. By and large, the implementation of strategies for teacher professional growth and development strategies shares metacognitive and social-emotional links that control the immersive experiences that any lesson plan is designed to achieve learning accomplishments and student skill development.

As it is noticeable from the prior research, EFL context accounts for a substantial ownership role concerning language input in its learners. In L2 environments, such use of L1 is welcomed for teachers and learners in an optimal in-lesson focus upon comprehension and clear discernment in the classroom, varying on own learner proficiency degree as teachers perceived it proper for grammar context but disadvantageous in its overuse (e.g. Algazo, 2022).

In addition to the teaching skills and motivational attitudes that a teacher emphasizes to comply with course

requirements and assemble educational quality, teaching commitment accounts for effectiveness in child skill milestones, yet delving into teacher perceptions elicits readiness for effective interventions that preempt learning slippage. This exploration unearths the stressors that govern the teacher's psyche, drawing awareness of the involvement the teacher places on addressing social and cognitive constructs in a regulatory process on the basis of experiences capturing the teacher's agency and crafting behavioural approaches for students through the teacher's views.

EFL instruction's teaching quality to learners is distinguished by the assessment judgments that delineate the student's performance on a range of activities in the exercise of critical thinking. In assessing the development of thinking skills, teaching methods in practice tend to impose a superficial requirement on knowledge before proceeding to broader measures of comprehension. Thus, learning outcomes in assessment are prone to teacher judgments as a linking factor in creating a vast array of biased judgments, as initial thinking skills mirror a perceived decline in performance (Jansen and Möller, 2022).

As the bottom line, upon the value of ensuring effective learning it is salient to pursue this understanding of positive teacher's judgments as it sows the seed in their learning journey by the values that teachers pass on in an inherently entrepreneurial environment shaped toward a teacher's perspective whose commitment to achieving goals aligns with the learner's expectations and interests.

## 2.3 | Teacher-student bonds as a moulding communication skills factor

To date, strategies that favour effective communication and teacher-student interaction across current modalities of study have involved the review of learner relational skills based on personality. Some studies have determined to sustain reflective rapport settings to increase learner performance and positive stimulus of cooperative activities under a flipped classroom model, in line with their own attributes set that exact a pivotal con-

nection in overall academic success (Durak, 2022).

Given this angle of contemplation, the teacher's liaison in feedback provisions a baseline where the students can engage themselves in both verbal and non-verbal communication contexts. However, when covering communication skills is commonly reported to be backfired against decoupled approaches to bypassing needed academic conventions in interactive spaces (Smith et al., 2022).

Support provided by the teacher to the child's academic development can be construed as a linguistic springboard for language communication in order to utter accurate and consistent intentions to the listeners. For some non-native speakers, an approach to enable polysemantic, self-explanatory and dissent-free meaning is hedging, so as to compensate their syntactic gaps in the learner's acquired repertoire on real-world cases (Tran and Tang, 2022).

While in L2 self-study scenarios, teacher-assisted feedback can be enlisted by filtering and praising each student's progress and performance through ongoing activities as a boost to their skill enhancement, an existing decrease is in student motivation, participation and attention may lead to peaks of partial achievement (He and Loewen, 2022).

The research described above on a specific goal requirement in learner development concerns approaches fitted in e-learning settings has been proven to be circumstantially beneficial. Yet, instructional delivery of such tools is unaffected by other approaches to support communication skills, such as using case discussions as a resource for their own problem-solving abilities (Koehler et al., 2022), or attaching strategies to the student-teacher interface alongside experiential triggers and congenial-like behaviours' exhibition to underpin long-term rapport while setting bonds and exchange with personalized pathways (Flanigan et al., 2022).

Pupil integration in the educational environment within such scenarios is designed as an emergent workaround, to some extent, with provisional learning methodologies. Since as an integral component for teacher agency readiness, reflective teaching parallels continuous innovation for learning opportunities by

**FIGURE 1** A two-way interactional model in language teaching for communication skills monitoring. Strategies-docked layers ported from [Smith et al. \(2022\)](#)'s toolkit implementations. Factor-related layers represented some teacher-student rapport triggers in [Väyrynen et al. \(2022\)](#); [Li and Mak \(2022\)](#); [Flanigan et al. \(2022\)](#); [He and Loewen \(2022\)](#) breakthroughs in their respective works.

adopting technological powered learner engagement solutions in digital teaching trends ([Chen, 2022](#)). Moreover, for this interest, this does not turn out to be a critical factor in the teacher-student rapport but rather the pertinent strategies deployed to meet a high quality educational output. Notwithstanding student learning differences, educators can deploy from performance evidence a learning student-centred framework relied on the underlying surroundings-linked factors on childhood learning conditions, attaching those learning barriers through practice ([Wexler et al., 2022](#)).

On top of learning bonds, individual student failure regards with missing connections with peers when absenteeism is persistent enough on the classroom level while remaining as a non-influential aspect on interaction-reliant conduct development individually ([Gottfried and Ansari, 2022](#)). Under such scenarios, a plausible interpersonal reliability suggests a dependence on peers to interact with classmates and prompts peer-to-peer communication first. Thus, ensuring a uniform peer-to-peer partnership is a paramount teaching goal when seeking high-level learners' achievement in terms of proficiency and engagement on L2 contexts ([Zabihi and Ghahramanzadeh, 2022](#)).

As denoted antecedently, linking a solid learning environment and rapport — as depicted in [Figure 1](#) — can range from minor tweaks to a differentiated staging

device adapted to environmental variables and learner background requirements. When conveying holistic skills, it may be necessary to analyse misconceptions about a learner's professional development priorities and competency acknowledgment insufficiencies in order for a proper learner's profile to flourish ([Chan and Chen, 2022](#)).

Except as otherwise language teaching, owing to L2 teaching methods connote a natural-goaled acquisition process, namely, Comprehensible Input ([Moran, 2022](#)) by importing how L1 comes acquired through exposure while steadily learners intentionally become well-versed employing language learnt. Lengthened teacher-student involvement demands are less feasible to occur in those explicit methodological cases. For an optimal integration in a literacy practices, stressing a developmentally content-oriented gain to cognition and comprehension process renders a noteworthy reasoning input ([Hicks, 2022](#)).

By this mean, guided instruction moments are somewhat sidelined on account of the learner's autonomous standing to pursue learning and individualized outcomes. Occurring on reckoning learner socioemotional status that can serve for classroom global accomplishment, as reported for self-worth study ([Leis et al., 2022](#)) to appropriate educators for ascertaining motivation degree of students and recognition of their own ability merit as an achievement indicator in reflective-instruction manners.

Similar usage is found for peer-reviewing reflections with teacher gains on augmented learning interactions and bestowing explicit instruction guidelines for learner practical involvement ([Väyrynen et al., 2022](#)). Attributable to this line of research, similar intents on student's motivation focus to ensure achievement can benefit from personality traits found in the classroom analysis, hinting a direct instruction in some cases. Indeed, engagement-led endeavours are advantaged in workflows' automatization, which are employed in e-learning methodologies, without relinquishing learner engagement for effortless scoring and timing activities ([Lam and Tse, 2022](#)).

A key aspect of these partnerships, given careful de-

sign, is collaboration tasks spotlighting social interaction enjoyment, particularly helpful for underachieving students on literacy development and teacher-student engagement through motivation and feedback assistance (Li and Mak, 2022). Few studies have comprised an unrecognizable approach adaptation from traditional methodology to achieve similar outcomes to the new modalities transition.

Some approaches' content emphasizes how proper and flexible communication tactics show to be vital mechanisms in both asynchronous and real-world settings. In the sense from teaching shifts, at large legacy discursive teaching has been integrated for addressing literacy learning featuring a decreasing teacher-led role in the exploration and discernment of lesson content for the learners (Chen et al., 2022a).

The opportunities for effective student-teacher interaction are ephemeral in these learning environments under precise approach techniques. It is critical to tackle classroom and behavioural factors that drive and maintain optimal communicative competence regardless of the learning modality. This comprehensive exploration attempts to shed light on the underlying factors in social interaction that result in promoting a discursive atmosphere and endowing learners with integral attributes.

## 2.4 | Present study

In shedding to light major components within communication skills focus on accord with literacy outcomes, a heuristic approach is deployed that exhibit connectedness in the educational practice in this sense for the sphere of the intrapersonal development of the pupil. To this end, similar design tendencies have been followed in distinguishing factors attesting to educational practice's success and research validity in its explicit application (Prochner and Godin, 2022).

Filling an intrinsic research niche in shifting methodologies in EFL settings, such a literature review yields a text-based roadmap tied to this study problem. Vast openings are afforded for inquiry efforts approaching this nature. Step-by-step designs are functional in leverage of reflecting qualities that enable a broad spec-

trum of facets unattached to a single methodology path Cleary et al. (2022).

In an attempt to accompany the early language adoption process whilst covering communicative development with regard to literacy progression along the way, a strategy of this kind is nurtured from several pupil engagement dimensions. Learner monitoring capitalizes on the rationale of engagement assurance to supply learning content mutually responsive to manifold scenarios (Derksen et al., 2022), and holds on epistemological and pragmatic conceptions belonging to connecting learner motivation and performance consistency as mirrored in the classroom (Hofverberg et al., 2022). Learning bonds gather a scalable process for learning interest and quality of outcomes in the assessment effects.

Technology-backed linkage of literacy outcomes with social emotional displays is by and large positive for learner autonomy and cognition process in flexible learning opportunities (McNaughton et al., 2022). Youth's cognition development brings to light variable treatment cases, which involves learners into a relishing procedure with reflective conversational strategies to strive to address their individual's behavioural state (Faulkner, 2022).

There is a value grounding in pursuing communication skills research for a controlled academic outcome predictors; it embraces ethical considerations and self-efficacy follow-ups for ensuring language achievement (Escribano et al., 2022). Hence, although numerical resolutions can hint at an identifiable spectrum, qualitative indicators call for complex multi-faceted assessment contexts so as to reflect key experiences for literacy component analysis purposes and scope of effects and coverage obtained.

Self-realization and networking activities sustain literacy abilities increment as an empirical component in connectivism strategies, which support both peer and individual intellectual development in language proficiency (Maawali, 2022). As such, the intentions of this study are to address both of these design constraints first and foremost. Reading and writing achievement may present very different results within the same study group.

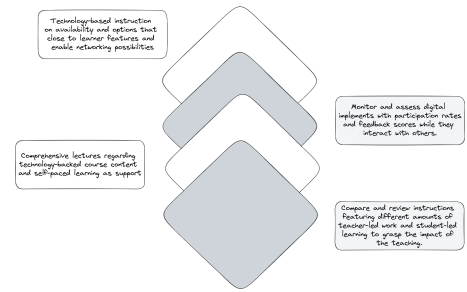

Accordingly, findings of this study are arrived at through the adoption of digital infrastructure for easing the monitoring of communication skills as a groundbreaking form of digital transformation [Kaputa et al. \(2022\)](#). As the study concerns the participants' literacy skills, improving these areas is worthwhile having dialogues-based instruction at a level that challenges the student to examine while grasping how literacy progress is achieved on their own abilities [Ryan et al. \(2022\)](#). Having reviewed the factors related to this study and students' literacy achievement, implications for the use of technology are raised when looking at the opportunities for literacy gain to favourably target their performance and engagement [Derksen et al. \(2022\)](#).

These considerations address this overt research on manners to ameliorate teaching practices in reading and writing domains and lead to enriched learning experiences for learners in digital applications. Consequently, within this study there are reflective processes undertaken within a heuristic spectrum which draws on the collected experiences attached to the behaviours presented in an interpersonal context, i.e. producing characteristic social environments.

As isolated contexts allow for an in-depth analysis of student performance for certain conditions that warrant closer support as well as the identification of learning gaps. Reading and writing development skills are conceptualized in linear constructs with correlations in the social and intrapersonal factors that arise in the environment. This allows elucidating relevant results in assessing the participants' degree of acquired literacy under various factors that shape their experiences.

With the incursion of a descriptive approach design, it aims at a socio-behavioural motion based on experiences derived from learning performance. Its status quo foregrounds a precise portrayal and insights of the interlocking themes and constructs scattered in the participant's and inner relationships that appeal to the research phenomena and focus.

A stack-type scenario was constructed in the embodiment of the logical formulation to digitally supported literacy instruction and to examine a bespoke teaching target on learner literacy progress beyond direct instruc-

**FIGURE 2** Strategy stack for addressing communication skills follow-ups in digital learning cases (after [Perevalova and Lucein, 2022](#)).

tion, as shown in [Figure 2](#). Each stack represents a crucial step in meeting the cognitive theory for integrated learning [Zhang et al. \(2020\)](#). As a result, the intentions of the study are illustrated by the effort involved in the monitoring of communication skills that are encouraged during class time while prompting reading and writing activities for subsequent performance review in each student.

Pondering communication skills follow-up as independent variable that can be altered for research outcome, this refers to the specific strategies or interventions used to support the development of communication skills in the classroom. Quality of learning engagement consequently covers the overall level of engagement and involvement that students demonstrate in their learning, as measured through methods such as observations, student surveys, and analysis of student work.

For a suitable interface with the methodology used in this study, a sequential explanatory scheme is given in the form of numerical data collection in the first instance, for follow-ups in support of the qualitative sampling that offers a comprehensive explanation into the context setting the findings emerged.

The research questions are hereby posed to beneficially fill existing gaps in student cognitive learning in the areas of literacy with a descriptive approach, as explained.

1. What are the existing gaps and bonds in reading and

writing abilities in L2 classroom?

2. How can participant's behaviours be moulded and covered when deploying communication skills follow-up to improve teaching environments?
3. Does the follow-up of communication skills contribute to improve learner literacy achievements and practices supported by teaching framework and its implementations?

Hereunder, a blueprint of the research is issued hereafter to examine the potential gains and setbacks that exist in an EFL classroom, with follow-ups on gradual communication skills. To wrap the intentions up, the core of the study and subsequent findings are addressed in the aforementioned research questions that pave the way to determining participants' learning achievements and their learning status.

### 3 | METHOD

This study is the product of a continuous work in following at major times of teaching in an EFL classroom the conditions and effects that occur when applying a framework of conditioning knowledge in the axis of communication among those involved. From 18 active young students' data, covering a teaching framework to cope with communication skills growth. Permitting participants to have a primary role in the knowledge building process renders a first-class output of their learning (Fatimah and Hidayat, 2022). It was commissioned to establish a key grounding in the search for information for the development of an educational environment that complements the interpersonal skills of learners while accompanying the course of learning, in which learning impairment may occur.

Participants were required to perform certain activities exerting significant value on writing composition and reading comprehension in a foreign language. Classroom understanding was conditioned prior to a diagnostic test that gave a clear perspective on the background of the study group's apprenticeship. With the incorporation of a mixed method, reducing the daily situations

of preconceptions when collecting data from the classroom is achieved (Chen, 2022).

As regards the mixed methodology, the heuristic approach allowed to deal with personalized topics in learning to trace a steady process as learners evolve in verbal and non-verbal communication, through the consideration of factors pertaining to social behaviour and school context.

Due to this reason, it is delved into such common situations in the digital classroom, in addition to interconnecting the output of students with writing and reading actions at an early age. Indeed, it employs digital tools for literacy classroom in set learning conditions while proving its effectiveness and scope (Lam and Tse, 2022). Being these activities in which meaningful relationships are created, and social skills are forged in order to achieve L2, students with skills corresponding to their learning level.

TABLE 1 Heuristic teaching design for covering communications skills follow-ups progressively in the EFL classroom

| Phase                           | Teacher-Led Work                                                                                                                                                                                                                                                                                                                                                                                 | Student Roles/Duties                                                                                                                                                                                             | Communication skills followup                                                                                                                                                                                                                                                                                 |

| Activation of Prior Knowledge   | After the lesson, the teacher reviews the satisfaction from the taught class to identify any areas that the students enjoyed or struggled with. The teacher should also review the questions and doubts that the students submitted and prepare responses for these. During the lesson, the teacher goes over the main points of the class and summarize the contents for learner understanding. | Students should go through the provided material at their own pace, taking notes and identifying any questions that arise. They should also complete any assigned activity.                                      | Review student satisfaction with the quiz after class<br>Respond to questions and doubts raised during and after class<br>Identify the types of questions that were most challenging for students<br>Identify writing and reading activities that caused students to become bored or perform poorly over time |
|                                 | <b>Educational scenario</b><br><br>The teacher leads a discussion to clarify any misunderstandings and to further engage the students with the material. The teacher should also incorporate interactive activities, such as quizzes or autonomous work, to facilitate the students' understanding and retention of the material.                                                                | Students actively participate in the discussion and in the interactive activities, asking questions and contributing their own ideas. They should also take notes and complete any assigned in-class activities. | Encourage students to ask questions and clarify any misunderstandings<br>Help students develop critical thinking skills by posing open-ended questions<br>Monitor student engagement and adjust teaching approach as needed                                                                                   |
| Make a headway                  | The teacher provides feedback on the students' progress, identifying any areas where they are excelling or struggling. The teacher should also address any questions or concerns that the students have.                                                                                                                                                                                         | Students reflect on their own progress and identify any areas where they need to improve. They could ask for help or clarification if needed.                                                                    | Encourage students to explain their thought processes and reasoning<br>Help students learn to communicate their ideas clearly and effectively<br>Promote collaboration and exchange through group activities.                                                                                                 |
|                                 | <b>Self-regulation</b><br><br>The teacher reviews the material covered in the lesson and should provide additional resources, such as practice problems or supplementary readings, for the students to further their understanding.                                                                                                                                                              | Students utilize the additional resources to consolidate their understanding and to practice applying the concepts they have learned.                                                                            | Encourage students to ask questions and clarify any misunderstandings<br>Help students develop critical thinking skills by posing open-ended questions<br>Monitor student engagement and adjust teaching approach as needed                                                                                   |
| Review communication procedures | The teacher assigns a writing or reading activity for the students to complete outside of class. This could be a summary of the material covered in the lesson, a analysis of a text, or free topic.                                                                                                                                                                                             | Students complete the writing or reading activity to the best of their ability, seeking help or clarification if needed.                                                                                         | Encourage students to communicate their ideas and findings to the class<br>Help students develop the skills to present their work effectively<br>Promote communication and supply doubts for the task                                                                                                         |
|                                 | <b>Overall amusement</b><br><br>The teacher reviews the students' completed writing or reading activity and provide feedback on their performance. The teacher should also review the satisfaction for the current class and prepare for the next lesson based on the students' feedback.                                                                                                        | Students reflect on the feedback they received and identify any areas where they need to improve. They should also complete the satisfaction survey.                                                             | Encourage students to reflect on their learning and progress<br>Help students develop the skills and discover their strengths and flaws<br>Provide comments and practice on learner performance                                                                                                               |

For the development of the research, students completed a non-sequential series of post-lecture learning activities, so as to generate a real-life view of students' favourable skills after an expected acquisition of knowledge, which included points on the student's immersion in the activity, problem-solving skills, management of item deadlines, non-dependence on cues in class. For a detailed walkthrough, the teaching design embraces effective scenarios for communication skills considerations back on [Table 1](#). Henceforth, the participants undergo a debriefing process on a multidimensional spectrum of assessment of their discursive skills and teaching outcomes, as well as discovering which content is best accepted and clarifying which type of content is preferred above others.

### 3.1 | Data gathering plan

Through exploration and discovery of relevant insights, instruments of mixed degree profess to cover those needs of literacy improvement. Deeming experience and perspectives of the stakeholders, this study yields a flexible approach to data collection and analysis. Within this branch, communication skills involve a series of constructs and themes for the evaluation of performance in learning activities.

In this field, research efforts are focused on immersive learning experiences that can be replicated on a large scale. The main axes are perceived to be learner self-regulation, immersion, agency, endurance towards maintaining commitment rates or performance in the classroom. In the following sections, the content assessed in the classroom is presented in a variety of ways and approaches to engagement.

### 3.2 | Research paradigm

In studying the qualities of educational degree in EFL learners, it proposes the investigation of the most common assessment tools in writing and reading skills. Communication is paramount to the success of the course, the performance of a class can be judged in various ways, as with a specific area of study. The following

are the communicative skills review and how they condition what is known as literacy achievement in a constructivist paradigm.

For quantitative procedures, this paradigm seeks to grant learners an active role when they forge their learning procedure and awareness per se. Whilst posing various scenarios where research can take place, sample can be predicted on the reliability of results that are constructed in paradigmatic perspectives.

The built-in constructs provide links between important concepts and elements of the research for interconnectivity through the credibility of the verification of results with the participants. Indeed, the use of judgmental spaces can permit for broader interactions among the study variables, which are grounded in experience and contextual conditions.

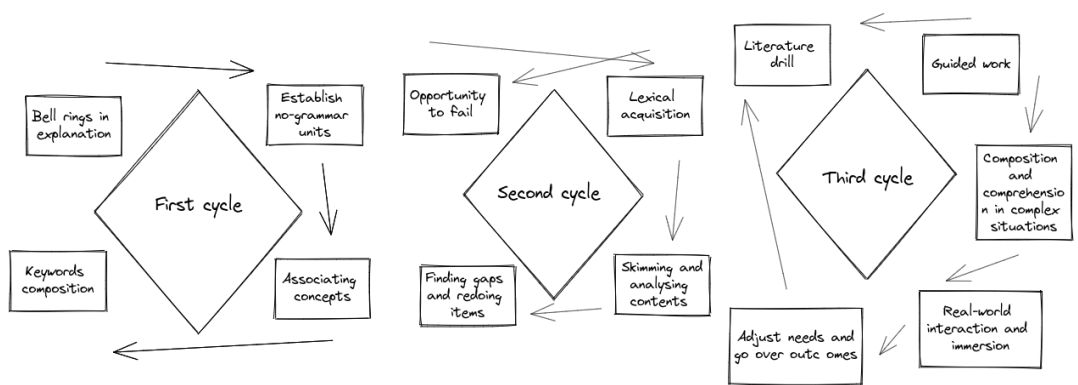

### 3.3 | Traits-based Research

A trait-based blueprint is implemented based on the traits of the participants, since the students are very volatile to the way in which a class can be accepted. [Figure 3](#) follows teaching patterns that reflect their attitudes and can learn from the performance and results of what is explained in class. The findings that can cause this type of research are of qualitative type for this purpose by selecting the participants in key areas that determine what works and what does not work for the study group. Through three key cycles, success is estimated in the motivation, sustainability and receptivity of the learner. This path follows notions in the embodied structure of the session-based classroom model based on learner production and evidence.

### 3.4 | Study sample

Towards the understanding and status of the study group, instrument design is covered, meeting the objectives of this study, within the data collection techniques, 9-10 year old learners were subjected to structured schemes for the assessment and collection of contents.

The study raises two main issues: to study the aca-

**FIGURE 3** Outline of schedule and achievements blueprints

ademic part, such as literacy learning; and the second issue is to know the relationships that learners are able to create in a learning area where they are the main stakeholders of their understanding. From that, how information is transmitted depends on the teacher, and how the information is received and interpreted is up to the learner.

The participants were asked to complete authentic tasks in academic and social contexts. Due to the nature of the given conditions, the number of participants is subject to variations, i.e. approximately 18 participants were part of the academic proportion of the study.

With planning based on sessions rather than weeks, the workload for early EFL students can be exhausting, but meaningful assignments and connections created in class provide an enjoyable and interactive space for participants, and their variable information is also limited in this quality study by omitting personal information.

As part of a structured observational instrument, the first instrument is presented for holding post-class learning instead of homework, which collects data based on drills, which turn out to be the most significant in the course of knowledge acquisition. It considers question types in order to judge the performance of each question in question delivery and combine their results in order to determine which question stands out from the rest and which needs help because it showed a lower score.

In another context, that is key is to monitor the ap-

titudes and behaviours of the students within each station that constitutes a class session and determine the behaviour that stands out the most from the group, thus implementing a monitoring behavioural chart as a second instrument. The aforementioned instruments have the same observational feature, however they consider a different learning environment, they occur sequentially.

It is also necessary to know the opinions of the participants and to determine the degree of satisfaction during the trial process, thus the survey structure is conceived after the 10 sessions, this comprehensive survey targets beyond a rating scale but achieving multidimensional context for encouraging learning practices in communicative spaces.

Thus, this serves for the study on identifying the learning gaps on behalf of the participants themselves, as well as the existence or not of misalignment in learning.

### 3.5 | Measures

From this point on, the study endeavours neither to rely only on numerical data nor solely on the theoretical basis included, rather to provide different learning loads to yield more accurate learning judgments when assessing student performance.

As shown previously, the study leverages this variable to its own strengths for the recognition and notori-

ety of phenomena beyond the discursive contexts.

At the outset, the assessment instrument may contain scales in the aforementioned subject constructs, however, due to the nature of the study, providing descriptive data in this setting allows for constant improvement in classroom content as well as research.

**TABLE 2** Performance factors and reliability statistics for post-class data

|                 | Mean | SD    | Item-rest correlation | If item dropped |            |
|-----------------|------|-------|-----------------------|-----------------|------------|
|                 |      |       |                       | Cronbach's      | McDonald's |
| Engagement*     | 3.14 | 0.690 | 0.438                 | 0.383           | 0.440      |
| Initiative      | 2.14 | 0.690 | 0.438                 | 0.383           | 0.440      |
| Self-regulating | 2.71 | 0.488 | 0.286                 | 0.516           | 0.657      |
| Timing          | 2.43 | 0.976 | 0.242                 | 0.607           | 0.657      |

\* reverse scaled item

EFL literacy instruction comprised several factors for the mixed study and teaching quality. For this part of the study, a series of applicable constructs are considered for theming in-class learning. All its elements benefit in the first instance to the effective positive teaching in the content of literary training for literary improvement as a target. Similarly, scale analysis to further remodelling and implementation of the course is provided from the data in Table 2.

Engagement, Initiative, Self-regulating and Timing items are presented in high mean scores and relatively low standard deviations. This suggests that the responses to these items are generally consistent and not very varied. The item-rest correlations for these items are also relatively high, which indicates that these items are related to the rest of the items in the scale. The Cronbach's alpha coefficient for these items is considerably high, which indicates that these items are reliable and measuring the same underlying construct. The McDonald's omega coefficient is similar, which further supports the reliability and internal consistency of these items. Overall, these items suggest that they are reliable and valid measures of the construct being studied.

Narrowing the scope of the classroom work, for qualitative purposes, it is employed from this point on to collect the most common behaviours within each class period on a sequential basis. This helps to explore students' experiences to provide input and feedback in or-

der to promote a range of acceptable classroom aptitudes.

Based on perceptions and observations, the next step in the research is to explore the behaviours/traits seen in and out of class sequentially. The measures represent the group's most frequent behavioural attributes such as engaged, distracted or confused; assessed based on communication during lecture, follow-up, homework prompting and long-term exchange especially around due dates.

For text-based data such as this instrument, a corpus analysis allows establishing trends in the different categories proposed in the study of classroom behaviour. Behavioural data are explored in comparing contexts of communication with their correlations with in-group traits.

The patterns found in this setting explore various aspects that are coded at the discretion of the research for tailored analysis. This leads to preliminary measurements that serve as a prelude to more complex data collection processes on the participants.

Subsequently, to gather the most significant parts of a class unit, participants are involved in accomplishing such a task. Understanding which unit is the most engaging for the participants leads to discovering which type of reading and writing activities function in the enjoyment of the task. In addition, this knowledge helps to compare survey results with grades to determine the relationship of educational quality and communication skills follow-up to classroom improvement.

Awareness of learners' gaps in language learning allows the implementation of activities over time in order to be better accepted by the participants and to improve performance later on. Furthermore, how the communication is perceived by the participants is assessed. The scales of the classroom intervention governed five contexts of follow-up in communication skills. As a descriptive statement, the quality is scalable in favour of tracking improvement in literacy traits. This study, by addressing the scales of development in practice, self-study, classroom, teacher-student communication, and homework, permits linking the individual's intrapersonal contexts with their progress and stagnation while at-

tempting to improve their writing and reading skills. Improvement in such skills involves a conscious learning process that is influenced by the teacher's communication practices.

## 4 | RESULTS

Among the major findings with respect to the title of the research, the main themes are exposed under certain test analyses that are proper to the focus of the study. From this point, it is proposed to deepen in the significant resolutions that prove to be of particular interest for the phenomenon of study.

Although there are several methods of data collection, some are intended to answer the themes related to the research questions. In other words, additional findings that do not end up making a noticeable contribution to the overall study are limited to a brief statement of their contribution to the scope of the ongoing research.

Initially, the gaps and linkages in EFL learning are addressed as they occur in sequential and programmed reading and writing activities. Following the learner's journey through learning encompasses major considerations, whereby the effectiveness of communication skills are tested in this study, underlying results are addressed through structured survey, communication contexts placed in the teaching process as self-perceptions of the participants in a multidimensional communication axis.

The learner's interests involved in a broader benefit and achievement of paramount acquisition, targeting the areas most appealing to the students brings about improvements in the educational practice and feedbacks duly exposed in depth.

In essence, the following descriptions help to elucidate teaching's perspective on how a student can be evaluated throughout a course for collective learning enjoyment and quality. Related factors and their associations are supported by the different compositions of the study area. Thus, these elements influence individually the present study.

### 4.1 | In-learning gaps and bonds to literacy achievements

Descriptive statistical findings concerning reading and writing achievement remain stable and robust in terms of variation. Preliminary findings made initially in reading skills merely represent bumps of declines in single-choice sorter questions, the latter rebounding later. Turning to activities involving both skills in coursework, results reveal setbacks on fill-in-the-blank questions in complex activities such as mazes, as well as on sentence rewriting, which involves first reordering sentences and following grammar as appropriate, and on composing knowledge related to the task. These tasks released lower accuracy levels as 43% and 41% respectively.

Thusly, the outline for that kind states a mean accuracy of the questions in the study which was 61.9% ( $SD = 12.1$ ), the median was 61%, and the maximum accuracy was 81%. This was based on 21 items of exploration across 8 units, holding 2-3 questions types per unit.

**TABLE 3** Exploratory results for writing and reading samples

| Descriptives        | N  | Missing | Mean | Median | SD   | Minimum | Maximum |
|---------------------|----|---------|------|--------|------|---------|---------|
| Writing and reading | 21 | 0       | 61.9 | 61     | 12.1 | 41      | 81      |
| Reading             | 10 | 11      | 52.5 | 54.5   | 13.1 | 29      | 75      |

Results between both sets of skills show results somewhat in favour of tracking skills with both achievements, as provided in Table 3. In the both groups, learning linkages are also addressed, as is the case for those exposed between the two sets and their determinants in their functioning. For the first part of the reading, results exhibit a higher increase of 27% for the single choice questions by the end of the units. Thus, being the variable that most replenished in the first stage. Multiple choice has a higher mean ( $M = 55.0$ ) despite having less concurrence, and single choice having a more pronounced deviation ( $SD = 18.96$ ). Moreover, sorter recorded the least change across units ( $SD = 11.47$ ).

For the second stage, large linkages are the result of blending both skills in the activities. Students showed an 80% improvement in filling in missing spaces ( $SD =$

11.51) when provided with a picture clue, similarly occurring at 81% with single choice questions (SD = 12.12) and a higher mean accuracy than the rest (M =78.05). This first one possessing the highest number of items with 8, followed by matching questions with 5 (SD = 9.91).

Constant peaks of quality in the fill in the blanks hint to take in particular consideration afterwards. The peaks are characterized by up to 50%, but in most cases remain overall more stable. However, it is not the case for question rewriting (SD = 56.0), which remains the lowest with no significant changes.

Altogether, these findings are outlined as an overview of which question types proved most difficult to succeed and which managed to remain high. Future considerations will refer to the exhibited and discernible gaps in learning. Strengths in a test might not always be reflected in a drop in performance, such as fill in the blanks.

### 4.2 | Common participants' traits on communications skills follow-up

Applying qualitative data analysis, students' aptitudes reflect major trends in behaviours such as: quiet (40), overwhelmed (30), hesitant (37), engaged (33), confused (32). These results coexist within a text analysis, as yield in Figure 4. With remarkable tendencies in the description of results, each session is viewed as a whole. Its categories showed results based on the axis of communication in the lecture, after the lecture, homework preparation, and communication in the free time after the sessions. The student-teacher interaction comprised 11 traits.

In terms of categories, the results show a higher number in quiet (12) within the first parameter, then quiet remains in the top with 11, the highest trait was surprisingly obtained in focused (12), and just as surprisingly, the opposite behaviour was obtained in confused (8).

FIGURE 4 Trends on aptitudes monitoring

### 4.3 | Communication skills follow-up as contribution for teaching practices

Findings point to the units most enjoyed by participants in sequential order with a 62%, i.e. Figure 5 display ranking order from survey, as the sorter of units that participants felt they enjoyed the most.

Due to the nature of the sorter, results show more than one unit possessing a top ranking from highest to lowest. Results indicate partiality for the practical examples that make up the top-ranked unit (25%), later repeating itself on other podiums within the overall results.

Students perceived that between the practical examples (50) and the quizzes (25), most of them proved to be complicated to solve. Likewise, within the type of questions characterizing each test, students found an inclination for free-writing (25%) and sorter (25%) tasks.

These results indicate, accordingly, that the variety of opinions is persistent, with 30% of them presenting multiple responses within the structured instrument.

On the other hand, the next stage for this interest dis-

FIGURE 5 Trends on aptitudes monitoring

covered communication skills factors in learning process for writing and reading outcomes through five themes: Practice, Self-study, Classroom, Communication, and Production.

For the first theme, there was a outstanding deal of support for communication given in practice (66) when it comes to taking guidelines, as well as finding parental support and control when doing class work with a concordance of 44. Among other things, when not completing a question, the results show a bigger inclination for parental notification (33%) over teacher (6%) as shown in an excerpt below.

*I take the test with parental supervision*  
(44%).

*I take the test without parental supervision* (11%).

#### Practice theme

In the second theme, participants corroborated help from parents or a close relative in completing homework assignments (67%), which is rarely given at the last minute (6%), among the type of skills contained in the homework assignments, reading was perceived as the most difficult skill (28%).

Classroom as a theme presents mixed considerations in the quality of showing careful attention to explanations in class (50%) as compared to not paying attention (17%), and likewise, for learners to perform in an environment of misunderstanding results revealed a higher reference to searching for oneself on the Internet (39%). Results indicate a significant intention to incorporate L1 in the delivery of instruction (33%) as compared to purely L2 instruction (22%).

Regarding self-study within this section, findings reveal an autonomy in performing learning activities (44%), as well as an initiative to review course material after a class (28%) and very few participants showed disinterest in not reviewing the learning platform (6%).

*I take the initiative to do my course tasks*  
(44%).

*My parents force me to do my course*

**FIGURE 6** Scenario-based accomplishments

tasks (17%).

#### Self-study theme

As a last scenario, within the options to clarify doubts within the student-teacher interaction, a behaviour of asking for clarification of content was positive (44%) while others highlighted a lack of having doubts in those cases (33%). As well as remarkable interaction and respect with greeting forms (72%). For the aspect of receiving feedback from the class, the results show high awareness of the support in class (67%) in most cases.

Alternatively, this study brings up results in terms of scenarios as well as the immersion to which the participants felt they were engaged. This instrument on communication associated to learning domains demonstrated that the participants actually learnt when they are subjected to completing the writing and reading activities.

Overall, the foundation was laid for learning rapport and how competence in this area determines the quality of education to establish learners as entities capable of working in various contexts progressively towards the acquisition of lexical and social features in their repertoire of knowledge.

This scope for Figure 6 addresses compelling factors that determine communication skills effectiveness and adaptability (SD = 2.1) across several contexts of rapport in their stakeholders. There is a positive focus on improving learning through follow-ups while mastering writing and reading assignments, which are enhanced by classroom practices. These notions created a valuable working space in improving the common failures

that occur in each learning model. The experiences that the students lived and took part in served significantly to their social and academic development, which is evidenced and put into practice progressively within the study.

## 5 | DISCUSSION

This project focused on improving educational practice as it relates to learners' reading and writing skills. Based on literacy achievement, results for reading progress suggested that question types of the same category maintain fluency in the learners. However, activities involving repetition may not correctly influence target language comprehension (Steinle et al., 2021). The evidenced gaps in this part of the study may be due to an issue of lack of intention to do the activities, i.e., this results in an adverse outcome of not following task instructions. Another factor in these results would be the overload of activities for the same session, since the lowest results are for the same unit.

Then, when combining a variety of ways of interacting with the content through strategy, the achievement motivation will be driven by these methodological staging Zhao et al. (2022). Given that this part was focused on not forcing the students to write, it is understandable that the absence of difficulty in doing the task but the lack of interest in it increased.

Higher results point to incredible benefits when supported by visual cues that allow more possibilities to interest the students in doing their best, as it worked in the last parts of the reading achievement. This aids can align with sustaining intellectual or emotional development by in-task optical prompts Khasanah et al. (2022)

Within the second stage, results suggested that students tend to present difficulties when the writing activities involve several activities in themselves, while better results are seen when the task is based solely on order to produce a sentence with an easily perceivable meaning. Thus, Fill in the Blanks suggests a tremendous opportunity to limit sets of activities to establish a single action or to explain broadly the order of activities to be

done in the activity. Drops in such a question type tend to present very varied results, and in this case, a triggering factor turns out to be in fulfilling the activity but not including the target language in the composition. As an upshot of negative transfer, that effect results in language mistakes (Canakli, 2022).

Where the teacher's role addresses target language misalignments in the rapport using corrective feedback (Nadifa, 2022).

Due to the interrelation of performance variability that can be placed throughout the coursework, the heuristic design also served as a teaching framework, which was nurtured by feedback from the course. Another purpose is for problem-solving features on learner motivation to real-world scenarios that this design implements (van der Ploeg et al., 2022)

For that reason, it became pivotal to discuss the strengths and weaknesses that participants had in accomplishing the tasks presented, with a leverage point for ongoing reflection when high and low points in learning occurred.

Covering strategies within explicit EFL instruction act to assure literacy achievement through task quality that learners produce consistently (Teng, 2022).

This outlook is achieved beyond a troubleshooting stance, such as establishing actions to address disparities in learning and improve practice and effectiveness with educational strategies in different perspectives on the problem as well as the needs of those involved.

Withal, results previously evidenced that the behavioural traits were characterised as containing substantial conformity, suggesting that the student's participation was achieved in meeting the requirements set forth in class but without central autonomy to carry out the communication by themselves. In addition, results from the first classes reflect connections with some characteristics, such as being focused on the class but quietly, as well as being confident, which was associated with self-resistance. This proves a realistic self-perception of themselves in learning at an early stage. Serving to set classroom relationships based on attentive behaviours, the instruction would lead to a personalised approach for entering communication practices

(Flanigan et al., 2022).

By a later stage of the course, engagement rises precipitously as the state of quiet is reduced but returns to an earlier position long before engagement. This would imply that students' episodes of engagement are shorter than those of remaining quiet in length. Thus, for that stage, being focused is not linked to being engaged but with quiet, which would imply a change of posture in the participants to a more positive one in learning. Learners' forms of communication, either verbal or non-verbal, represent an operational role in the learning process by their participation (Li, 2022).

Therefore, these behaviours do not disturb the understanding of the class to grasp the activities. Behaviour with positive connections to focus supports the notion that the behaviours seen in the classroom can be curved to improve educational practice based on outcomes. Similarly, this study produces in its design material used for monitoring the forms of communication throughout the course based on its scheduling. The achievements in reading and writing evidenced the perspective of the participants in immersing themselves in an enriched learning environment.

While these experiences at early age serve for building a solid cognitive ability in long-term learning performance (Chen et al., 2022b).

These results suggest that over time, each unit was perceived as more tedious to follow in most cases based on responses, which does not represent a methodological problem, but an intrapersonal challenge for the participants in terms of motivation and sustainability. EFL learners' motivation rates can turn into a drop-off when mastering a set of language skills (Naibaho, 2022).

In addition, there is a high appreciation of the didactic aids that were given before a test, being perceived positively for the clearer understanding of the students owing to realised burdens they felt to take a test after a lecture in almost all units. This would respond to the very demanding sequential completion loads for each student. Similarly, the fact that the results indicate learners preferred all question types in the assignments may point to increased quality and interactivity provided in these types of activities. Students prize critical lectures

when providing a deeper understanding and enlightenment practically (Shadiev and Huang, 2022).

Seamlessly, when evaluating multiple scenarios on communication skills, a conscious mean of responses in each scenario is demonstrated. Furthermore, this benefits improving the educational practice for any type of course regardless of the modality employed. Results reveal that the participants listened attentively to the guidelines in the classroom and especially within the practicum. The communication progression was noticeable in feedback and help from the assignments when outside of class time, as well as their willingness to interact in class if asked to do so. This suggests a commitment to follow through with activities and learning.

When learners have a proactive family engagement in their language development, this offers better autonomy in excelling in their skills (Andrew et al., 2022).

As learning featured on the learner-centred approach, it justified that teacher instruction often is not the single source of learning about subjects, as it can be with technology or parents. Finally, by proving that students tracked the direction of classroom activities, it implies a favourable development of learning and study habits for their future literacy development. Thus, L2 learning as a critical process can highlight familiar scenarios, sharing relatable activities to be immersed with (Minalla, 2022).

In a nutshell, the bond that communication skills provide with the improvement of skills is paramount to the education of young EFL learners through knowing the participants' perceptions of their learning performance as they are followed in terms of monitoring and insights. The findings within this study become crucial for decision-making in establishing a learning strategy that is personalised to the needs of the learners, in other words, learner-centred.

## 6 | CONCLUSION

The discovery of disadvantages among some students allows teachers to generate reflections that are evoked in the development and adaptation of curricula for new

learning trends and their effectiveness. With a focus on following the process of knowledge building, a classroom with active participants contains favourable qualities in stimulating learning experiences based on lessons learned within the educational space.

Within this teaching scenario, it prompts instructors to exercise their professional judgment in seeking out methodological tools that enable comparable results in any modality (Li and Yang, 2022). Among other things, monitoring students in various parts or activities in the learning process shares views on how the instruction functions and where there are bottlenecks, which are essential to identify in order not to undermine long-term learning achievement. In the classroom, external and internal factors within the environment that may contribute to a divergent orientation to learning must be considered.

One aspect that was addressed in this research was adaptability, which must be subject to change and incorporation for any case use related to education, especially in EFL. As such, further work should pay attention to learner follow-up. It is beneficial to establish educational materials open to frequent tweaking to gain and tune in learning from the learner's shortcomings and to understand what works and to what extent it can be exploited for classroom success. For ensuring academic success, classroom content should be applied amid miscellaneous contexts for the connectedness of literacy development and self-reliant engagement (Derksen et al., 2022).

On the other hand, with an educational methodology mindful of the student's demeanours to acquire skills, shaping the socio-behavioural features of the students would naturally lead to methodological aids to correlate and promote appropriate traits through instruction and internal implementations.

The precision of classroom design and strategies can involve challenging to perceive or overlooked factors that impact considerably on the quality of learning. Learning techniques can work to some extent when factors such as motivation, interest, monotony, and a perceived sense of not learning occur so that students exert less effort to become immersed in a variety of learning

contexts. When dealing with learning needs to digital access, it is critical to reckon those roadblocks learner face to engage in learning, requiring a suitable input in language development Smith et al. (2022).

Despite some constraints that can emerge in the deployment of similar intents for literacy outcomes, a face-to-face intervention can have more satisfactory benefits for attendance and teamwork engagement. Those aspects could be addressed in depth for upcoming investigations, owing to boundaries found for that purpose. While core considerations can be reflected in personal and tailored activities for raising this branch of study in the educational scope. As this study was made in young learners featuring developing countries' archetypes, the application can not be generalised for expecting equivalent results but optimised for learners' conditions in classroom objectives if suitable.

Within this branch of education, replicability is planned in its design from a certain point of view to be integrated into L2 instruction. Possible constraints on the application may be subject to specific variables not valid in this study, but applicable in other use cases. Awareness of the factors in each case is essential for effective learning achievement, especially when language domains are involved. Further studies can proceed to investigate the learner's perspectives on teaching practice to establish a personalised strategy for several contexts.
